

# Topic Modeling & Creativity

Savannah Johnson

1/24/2021

## Research Questions

Lucas & Nordgren (2020) created a series of studies testing whether or not people understood the trends of their own creativity over time. The researchers collected data on what they thought about their personal creativity when responding to prompts, their responses, and creativity scores that come from trained raters. For the purposes of this data science project, I am using the results from study 4, which asks participants to come up with innovative products that a university bookstore can sell to help roommates get along better. I will be performing topic model analyses on the raw data to answer this main question:

Are there certain topics that are associated with higher creativity scores?

## Loading in packages to prep for analyses

```
library(tidyverse)
library(readxl)
library(dplyr)
library(tidytext)
library(tm)
library(topicmodels)
library(wordcloud)
library(stm) #not loaded in yet
library(reshape2) #supposedly needed to do tidy matrices
library(ggplot2)
library(psych)
```

## LDA Topic Modeling

For this part of the project, I will be using Latent Dirichlet Allocation Topic Modeling to answer my research question.

## Selecting and Cleaning the Data

Load in Lucas' creativity data set and filter to focus just on study 4 (the University bookstore task).

```
study4 <- read_excel("Studies_1to7.xlsx") %>%
  filter(study == 4)
```

Load in the raw data for the University bookstore task. Filter subject 51 and 149 from the data set because they were excluded in the creativity analyses due to a failed attention check.

```

study4_rawdata <- read_excel("study4_lucasResponses.xlsx")

study4_rawdata <- study4_rawdata %>%
  filter(!subj %in% c("51", "149")) %>%
  select(-4)

```

## Unnest Tokens

Unnest tokens, so that each individual word is their own row

anti\_join is a function that allows you to take out words from the analysis. Here, we want to take out stop words.

Filter out the words that aren't products and are a part of the prompt, like roommate.

Then count the number of words for each subject to prepare to cast the document term matrix.

```

study4_unnested <- study4_rawdata %>%
  select(-time_period) %>%
  unnest_tokens(word, idea_text, drop = FALSE) %>%
  anti_join(stop_words) %>%
  filter(!word %in% c("roommates", "roommate", "room", "roomate", "roomates",
                     "product", "bookstore", "sell"))

study4_wordcount <- study4_unnested %>%
  count(subj, word)

```

## Cast dtm

Cast the document term matrix, using all the responses of one subject as a document.

```

dtm <- study4_wordcount %>%
  cast_dtm(document=subj, term=word, value=n)

as.matrix(dtm)

## Find optimal k

### Perplexity

In order to fit a topic model, we must first explore how many topics we might have. By looking at perplexity scores, a significant drop off looks like it is happening after setting k to 9. So, since there isn't a large change from one topic to the next looking at the perplexity score, we can assume there are 9 topics within this corpus.

```

LDA_2model = LDA(x=dtm,
                  k=2,
                  method="Gibbs",
                  control=list(alpha=1, delta=0.1, seed=12345))

perplexity(object = LDA_2model, newdata = dtm)

## [1] 1693.294

```

## Log-likelihood

Can also predict the best fit of topics by retrieving the log-likelihood. The larger the number the better (aka the less negative the better)

```

logLik(LDA_2model)

## 'log Lik.' -126711.1 (df=8880)
#-126711.1

logLik(LDA_3model)

```

```

## 'log Lik.' -123636.2 (df=13320)
#-123636.2

logLik(LDA_4model)

## 'log Lik.' -121309.7 (df=17760)
#-121309.7

logLik(LDA_5model)

## 'log Lik.' -120304.9 (df=22200)
#-120304.9

logLik(LDA_6model)

## 'log Lik.' -119052.8 (df=26640)
#-119052.8

logLik(LDA_7model)

## 'log Lik.' -118267.8 (df=31080)
#-118267.8

logLik(LDA_8model)

## 'log Lik.' -117746.6 (df=35520)
#-117746.6

logLik(LDA_9model)

## 'log Lik.' -117034.5 (df=39960)
#-117034.5

logLik(LDA_10model)

## 'log Lik.' -117193 (df=44400)
#-117193

logLik(LDA_11model)

## 'log Lik.' -116600.5 (df=48840)
#-116600.5

logLik(LDA_12model)

## 'log Lik.' -116063.4 (df=53280)
#-116063.4

```

## Create the LDA model with best k

Based off of the perplexity and log-likelihood scores, set k equal to 9, and run the LDA function.

```
LDA_model = LDA(x=dtm,
                 k=9,
                 method="Gibbs",
                 control=list(alpha=1, delta=0.1, seed=12345))
```

Retrieve the probabilities of words belonging to topics from the beta matrix.

```
beta <- tidy(LDA_model, matrix = "beta")
```

Gamma matrix shows the prevalence of topics for each document. The code below creating the gamma data frame displays the probabilities of topics in documents side by side.

```
gamma <- tidy(LDA_model, matrix = "gamma")

tidy(LDA_model, matrix="gamma") %>% spread(topic, gamma)

## # A tibble: 149 x 10

```

This bar graph displays top 10 words for each topic and was also useful for helping identify topic names.

```

top_terms <- beta %>%
  group_by(topic) %>%
  top_n(10, beta) %>%
  ungroup() %>%
  arrange(topic, -beta)

top_terms %>%
  mutate(term = reorder(term, beta)) %>%
  ggplot(aes(term, beta, fill = factor(topic))) + geom_col(show.legend = FALSE) + facet_wrap(~ topic, s

```

## Creativity comparisons with topics

Create a data frame that includes topic probability for each subject/document, as well as average creativity scores.

```
gamma_wide <- gamma %>%
  mutate(document = as.integer(document),) %>%
  pivot_wider(names_from = "topic",
              values_from = "gamma",
              names_prefix = "t") %>%
  rename(localid = document)

creativ_score <- study4 %>%
  select(localid, c1, c2, c3, c4, c5) %>%
  pivot_longer(2:6, names_to = "time_period", values_to = "creativity_score")

creativityMean <- creativ_score %>%
  group_by(localid) %>%
  summarize(meanCreat = mean(creativity_score),
            n = n())

creativity <- creativityMean %>%
  select(localid, meanCreat) %>%
  mutate(localid = as.integer(localid))

topic_ratings <- full_join(gamma_wide, creativity,
                           by = c("localid"))
```

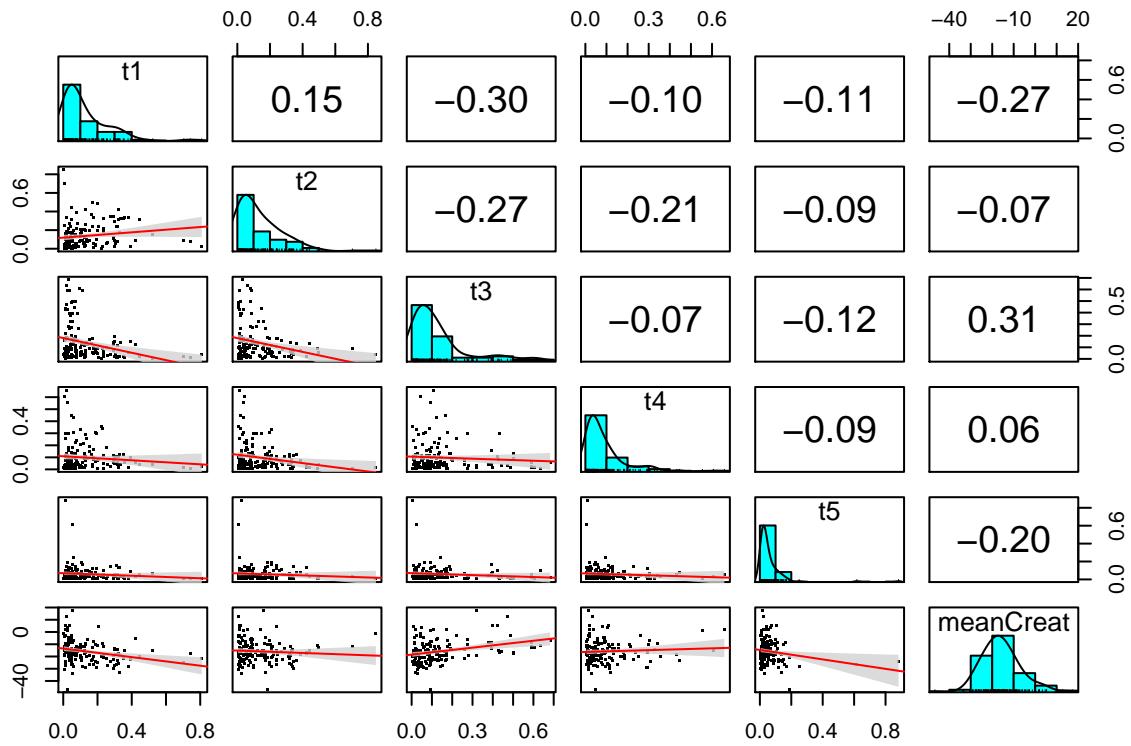

## Correlations

Below are the correlations of topics and creativity scores. They are split up into two SPLOM plots for better viewing purposes. Topics 2, 4, 7, 8, and 9 are not well correlated with mean creativity scores. Topics 1 and 5 have a moderately weak, negative correlation meaning words from these topics are associated with lower creativity scores. Topics 3 and 6 have a moderately weak, positive correlation, indicating that these two topics are associated with higher creativity scores.

```
library(psych)

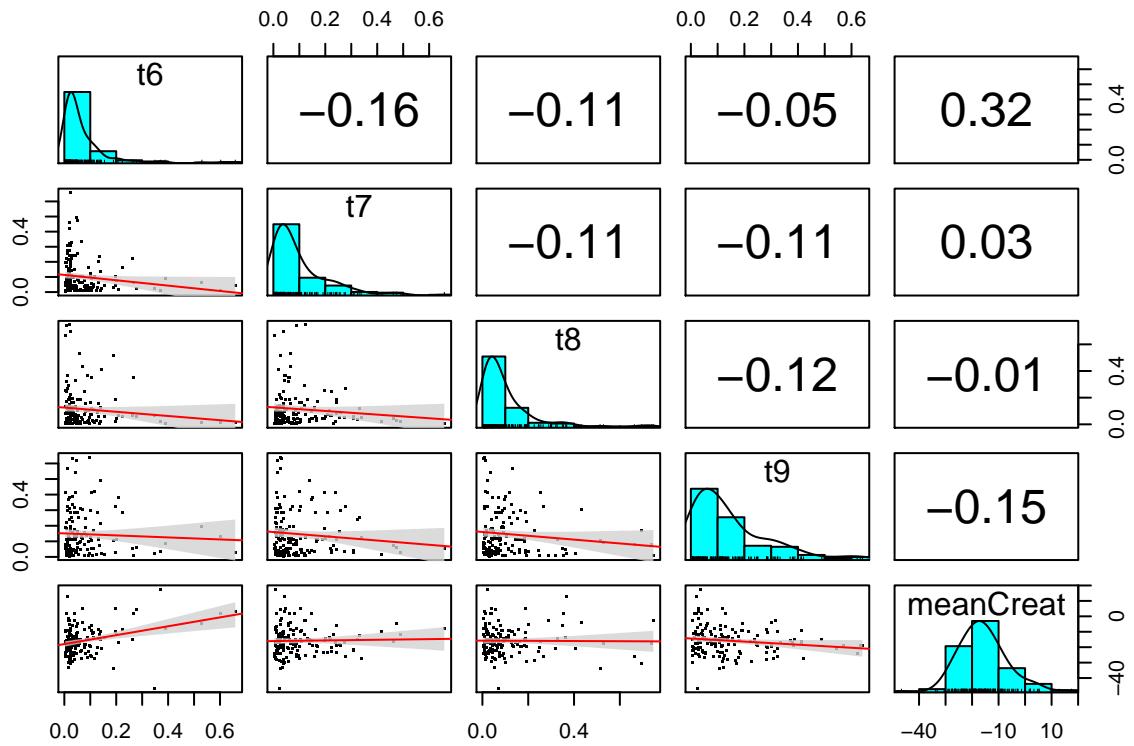

topics1thru5_ratings <- topic_ratings %>%
  select(t1, t2, t3, t4, t5, meanCreat)

pairs.panels(topics1thru5_ratings,
            jiggle = TRUE,
            ellipses = FALSE,
            lm = TRUE,
            ci = TRUE,
            pch = ".",
            scale = FALSE,
            factor = 2)
```

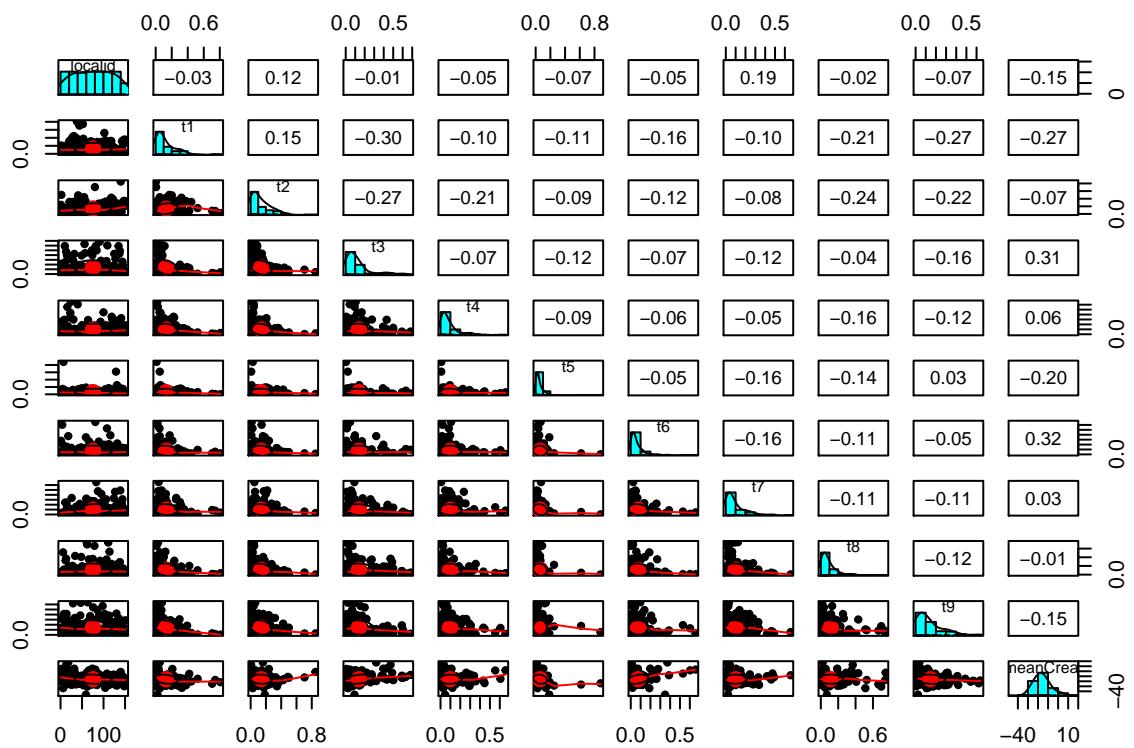

```
topics6thru9_ratings <- topic_ratings %>%
  select(t6, t7, t8, t9, meanCreat)
```

```
pairs.panels(topics6thru9_ratings,
             jiggle = TRUE,
             ellipses = FALSE,
             lm = TRUE,
             ci = TRUE,
             pch = ".",
             scale = FALSE,
             factor = 2)
```

```
pairs.panels(topic_ratings,
             scale = FALSE)
```

## Mulitple Regression

Since topics 2, 4, 7, and 8 do not correlate much with mean creativity, we will exclude them from regression analyses. In order for a regression to work, items must be independent of each other. However, topic prevalence adds up to 1, so these topics are not independent of each other. This is why we are excluding the low-correlated topics from analysis, since it is already evident they will play little role in accounting for creativity.

Results: As shown by the multiple R-squared statistic, the proportion of variance explained in human-rated creativity scores by topics 1, 3, 5, 6, and 9 is about 27.86%.

```
library(lm.beta)

reg1 <- lm(meanCreat ~ t1 + t3 + t5 + t6 + t9, data = topic_ratings)

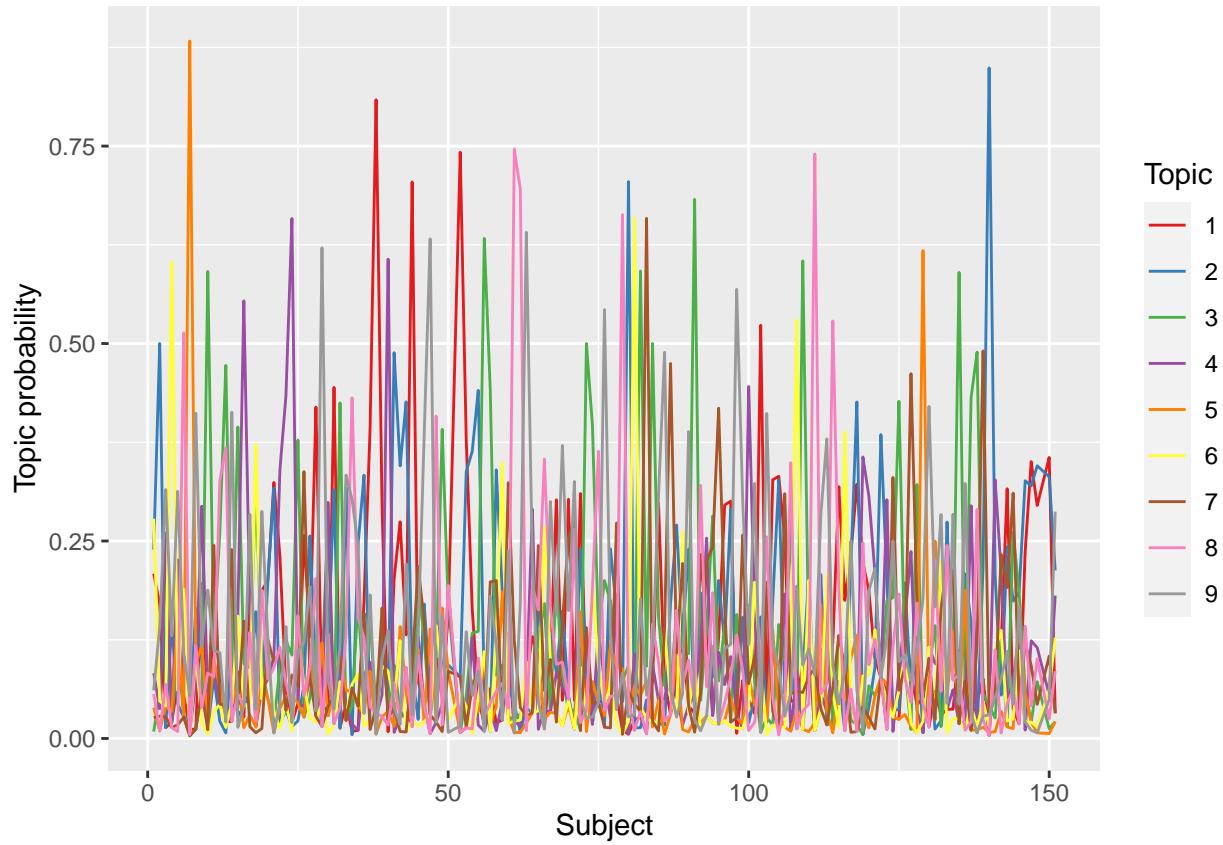

summary(reg1)

```

## Visualizations

This graph shows the prevalence for each topic in every document.

```
tidy(LDA_model, matrix="gamma") %>%
  mutate(document=as.numeric(document)) %>%
  ggplot(aes(x=document, y=gamma)) +
  geom_line(aes(color=factor(topic))) +
  labs(x="Subject", y="Topic probability") +
  scale_color_manual(values=brewer.pal(n=9, "Set1"), name="Topic")
```

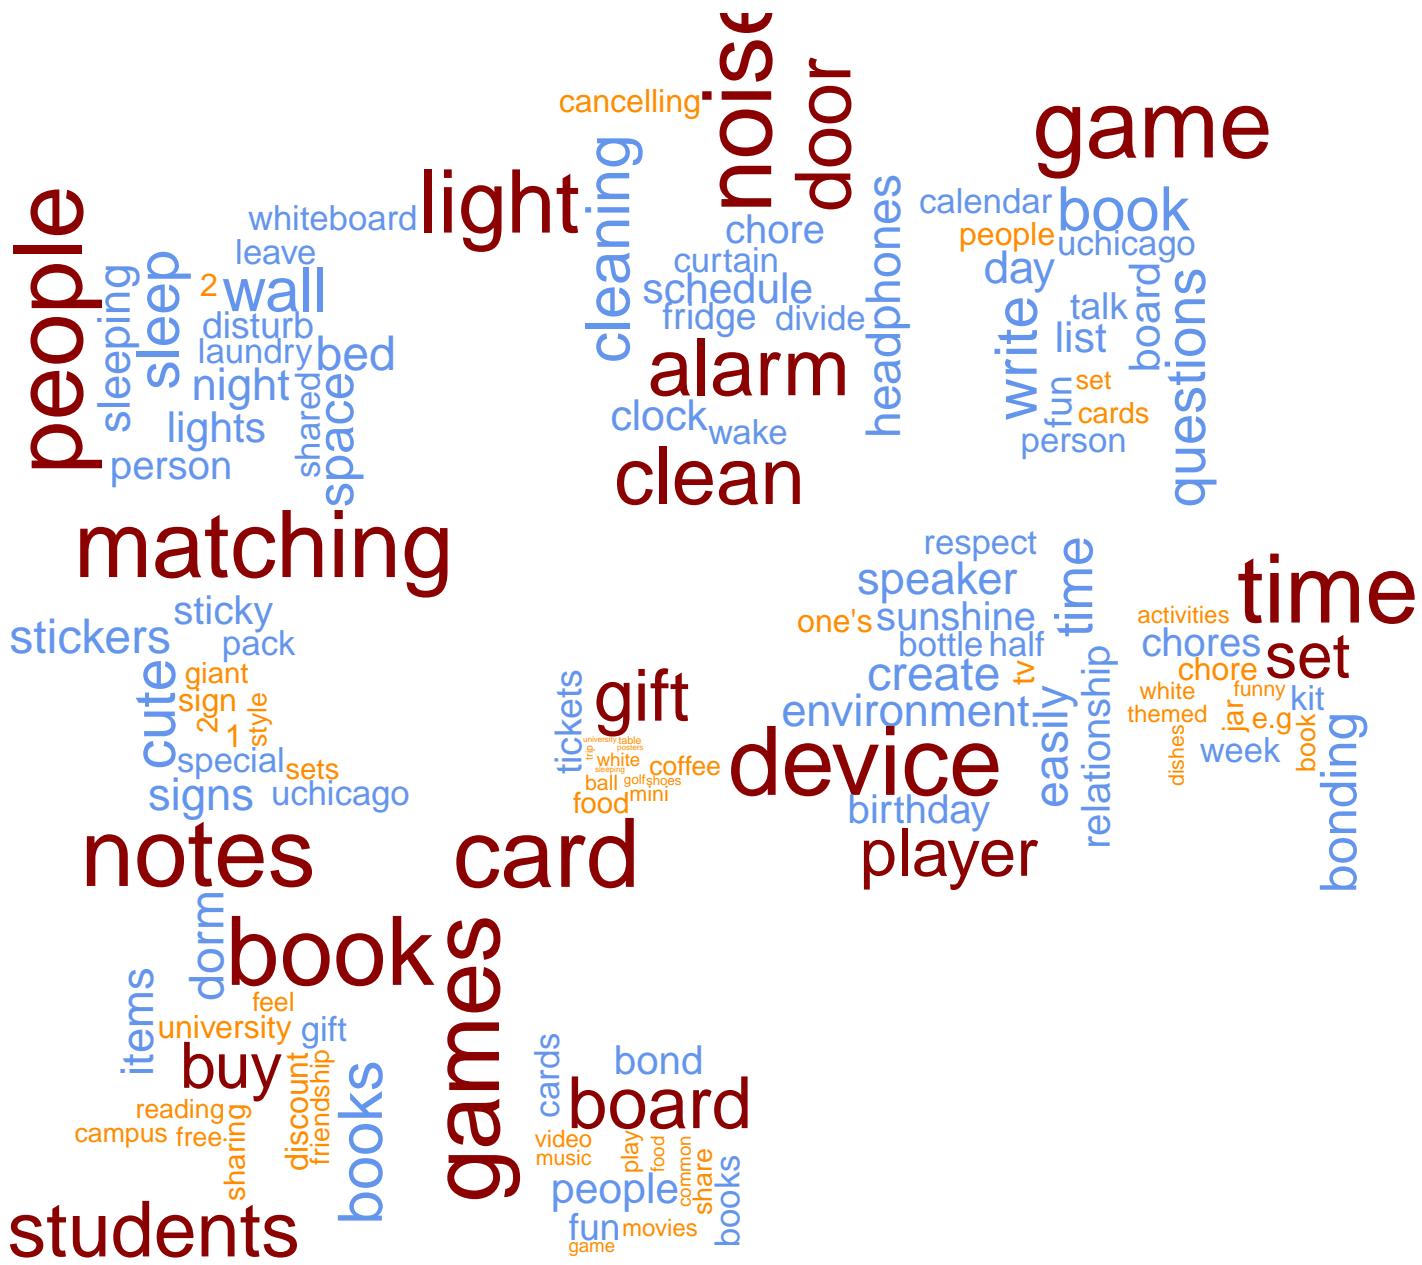

## Word clouds

Below are wordclouds for each topic based off of the highest word frequencies in each topic for the layperson to visualize.

```
# Display wordclouds one at a time
for (j in 1:9) {
  word_frequencies <- tidy(LDA_model, matrix="beta") %>%
    mutate(n = trunc(beta * 10000)) %>%
    filter(topic == j)

  # Display word cloud
  wordcloud(word = word_frequencies$term,
            freq = word_frequencies$n,
            max.words = 15,
            scale = c(3, .05),
            colors = c("DarkOrange", "CornflowerBlue", "DarkRed"),
            rot.per = 0.3)
}
```

## STM Topic Modeling

The following analysis, is another form of topic modeling, utilizing the STM method.

## Prepare data frames for analysis

First, unlike in LDA, we need every row to be a document. The following code essentially unites by rows.

```
rawdata2 <- study4_rawdata %>%
  rename(localid = subj) %>%
  select(-time_period)
```

```

rawdata3 <- rawdata2 %>%
  group_by(localid) %>%
  summarize(resp=paste(idea_text,collapse=","))

```

Now, we need an average creativity score based off the 5 human creativity ratings for each subject/document.

```

creativ_score <- study4 %>%
  select(localid, c1, c2, c3, c4, c5) %>%
  pivot_longer(2:6, names_to = "time_period", values_to = "creativity_score")

creativityMean <- creativ_score %>%
  group_by(localid) %>%
  summarize(meanCreat = mean(creativity_score),
  n = n())

```

Full join the two data sets to create one for analyses.

```

creativity <- creativityMean %>%
  select(localid, meanCreat) %>%
  mutate(localid = as.integer(localid))

data <- full_join(rawdata3, creativity,
  by = c("localid"))

```

Create a new ID because the stm function will remove the original ID column.

```

data2 <- data %>%
  mutate(newID = 1:n()) %>%
  select(-localid) %>%
  rename(documents = resp)

```

Then, use the textProcessor function to separate documents and vocabulary. Here, I removed stop words, a few custom words that were likely to consistently be repeated because of the prompt, and removed numbers. Finish performing these corpus manipulations by using the prepDocuments function.

```

processed <- textProcessor(documents = data2$documents,
  removestopwords = TRUE,
  customstopwords = c("roommate",
  "roommates",
  "roomate",
  "roomates",
  "e.g",
  "university"),
  removenumbers = TRUE,
  stem = FALSE)

## Building corpus...
## Converting to Lower Case...
## Removing punctuation...
## Removing stopwords...
## Remove Custom Stopwords...
## Removing numbers...
## Creating Output...

out <- prepDocuments(documents = processed$documents,
  vocab = processed$vocab)

## Removing 4388 of 6307 terms (4388 of 16234 tokens) due to frequency

```

```
## Your corpus now has 149 documents, 1919 terms and 11846 tokens.
```

## Find optimal K

Use searchK function and then plot to visualize log likelihood, residuals, and semantic coherence when using each number of topics.

After plotting the text\_searchK data, semantic coherence for topic 4 is the best, making the first peak dip of coherence at topic 6. So based off of the text\_searchK plot, it is safe to say 3, 4, and 5 are good options for the optimal K.

```
set.seed(1)
text_searchK <- searchK(out$documents, out$vocab,
                        K = c(2,3,4,5,6,7,8,9,10),
                        init.type = "Spectral")

## Model Converged
plot(text_searchK)

```

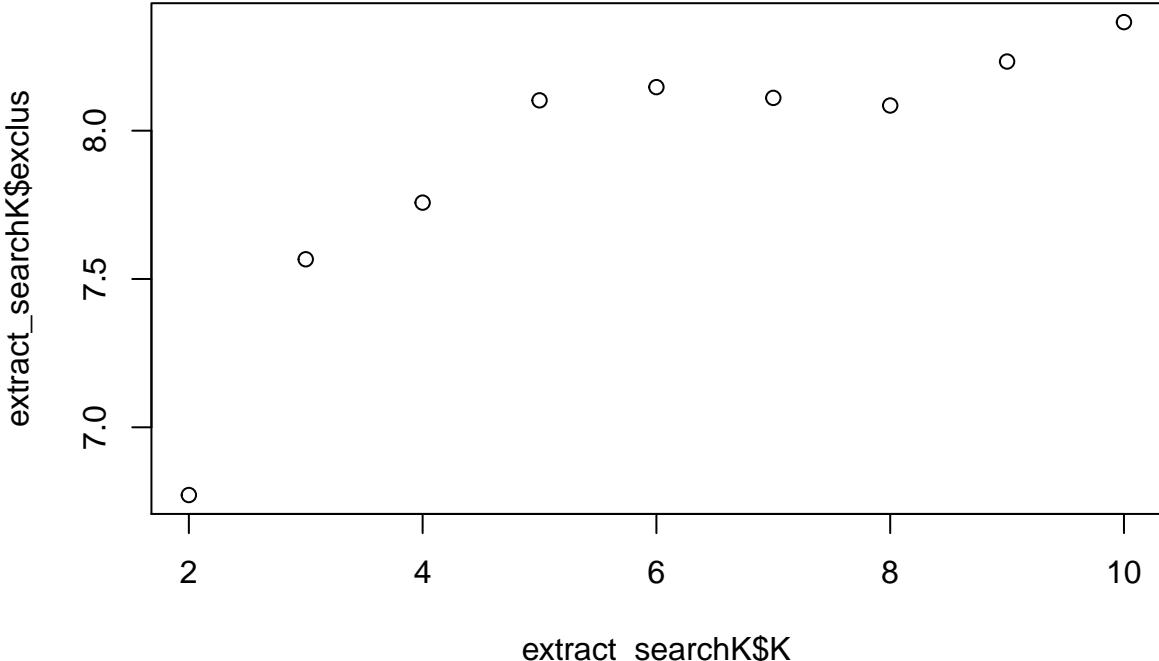

## Diagnostic Values by Number of Topics

Now, extract exclusivity from the search for  $K$  results and plot in a graph. There is a big jump in exclusivity from 2 to 3, steadily increasing until 5. So still, 3, 4, and 5 are good options for the optimal  $K$ .

From my view, while semantic coherence is highest at 4, 5 topics is the point where the exclusivity essentially peaks, although it is not much higher than 4.

```
extract_searchK <- text_searchK$results
plot(extract_searchK$K, extract_searchK$exclus)
```

## Find optimal K via different stm() after narrowing via bestK()

Since an argument can still be made for K to be 3, 4, or 5, look at which number of topics would have the highest exclusivity average by plotting.

Highest exclusivity score is located at 4.

```
text_stm_3 <- stm(documents = out$documents, vocab = out$vocab,
                    K = 3,
                    max.em.its = 75,
                    init.type = "Spectral")

## Model Terminated Before Convergence Reached

ex3 <- exclusivity(text_stm_3)
ex3 <- mean(ex3)

ex4 <- exclusivity(text_stm_4)
ex4 <- mean(ex4)

ex5 <- exclusivity(text_stm_5)
ex5 <- mean(ex5)

K <- 3:5
ex <- c(ex3, ex4, ex5)
ex <- data.frame(K, ex)
plot(ex$K, ex$ex)

```

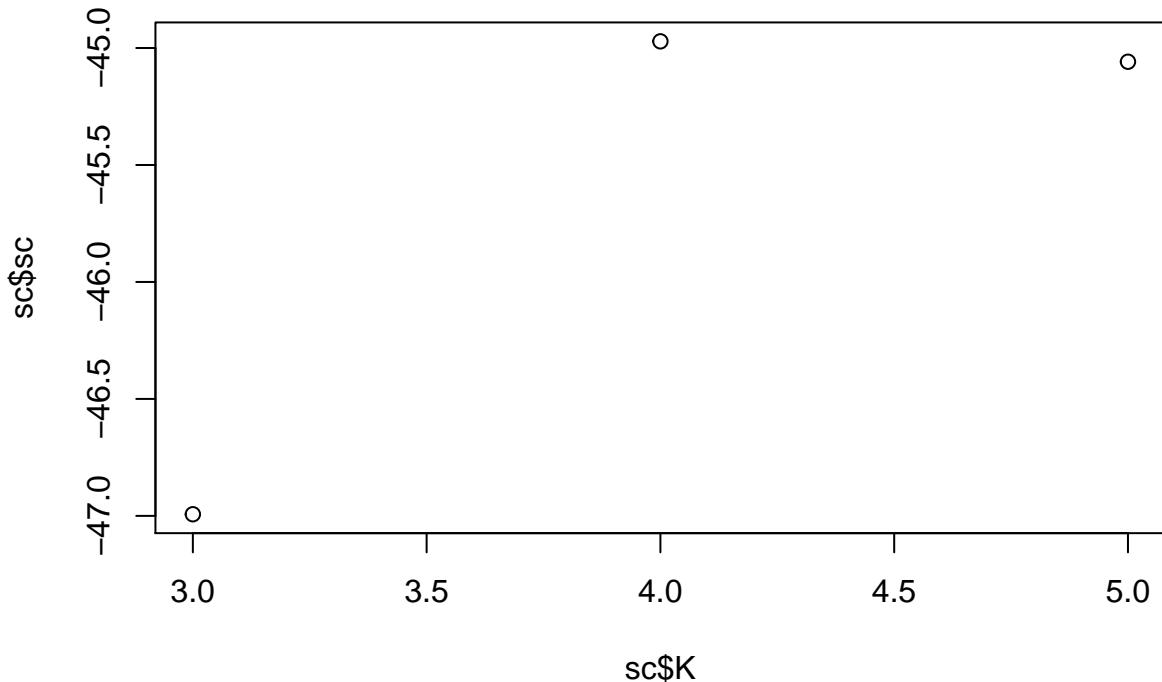

Now look at which has the highest semantic coherence average.

```
sc3 <- semanticCoherence(text_stm_3, documents = out$documents)
sc3 <- mean(sc3)

sc4 <- semanticCoherence(text_stm_4, documents = out$documents)
sc4 <- mean(sc4)

sc5 <- semanticCoherence(text_stm_5, documents = out$documents)
sc5 <- mean(sc5)

K <- 3:5
sc <- c(sc3, sc4, sc5)
sc <- data.frame(K, sc)
plot(sc$K, sc$sc)
```

Use selectModel function with optimal K to find best model

```
text_select4 <- selectModel(out$documents, out$vocab, K = 4,
                           max.em.its = 75,
                           runs = 20,
                           seed = 1)
```

```

Use FREX values, which measure exclusivity while balancing word frequency, by extracting them and then graphing the top words.

```

##### Stewart's code
frex_values <- function (stm_obj, w = 0.5, wordcounts = NULL) {
  logbeta <- stm_obj$beta$logbeta[[1]]
  excl <- t(t(logbeta) - stm::::col.lse(logbeta))
  if (!is.null(wordcounts)) {
    excl <- stm::::safelog(sapply(1:ncol(excl), function(x) js.estimate(exp(excl[,
      x]), wordcounts[x])))
  }
  freqscore <- apply(logbeta, 1, data.table::frank)/ncol(logbeta)
  exclscore <- apply(excl, 1, data.table::frank)/ncol(logbeta)
  frex <- 1/(w/freqscore + (1 - w)/exclscore)
  frex
}

```

```
##### End Stewart's code
```

Create data frame that has FREX values and the terms

```
beta_4 <- tidy(text_stm_4, matrix = "beta") %>%
  pivot_wider(names_from = "topic", values_from = beta,
  names_prefix = "b" )

words_frombeta <- tidy(text_stm_4, matrix = "beta") %>%
  select(term) %>%
  distinct() %>%
  data.frame()

just_frex <- data.frame(frex_values(text_stm_4))

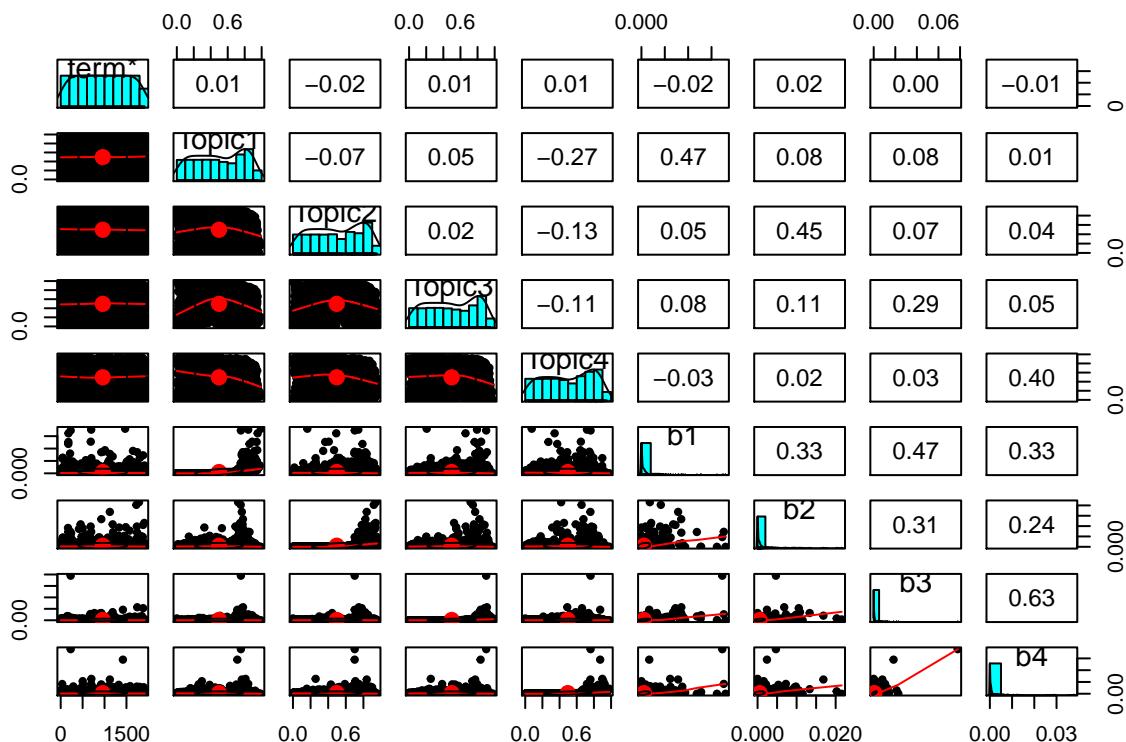

word_frex <- bind_cols(words_frombeta, just_frex) %>%
  rename(Topic1 = X1, Topic2 = X2, Topic3 = X3, Topic4 = X4)
```

Create another data frame that has the FREX and beta value for each topic.

```
library(psych)

frex_beta <- full_join(word_frex, beta_4)

pairs.panels(frex_beta)
```

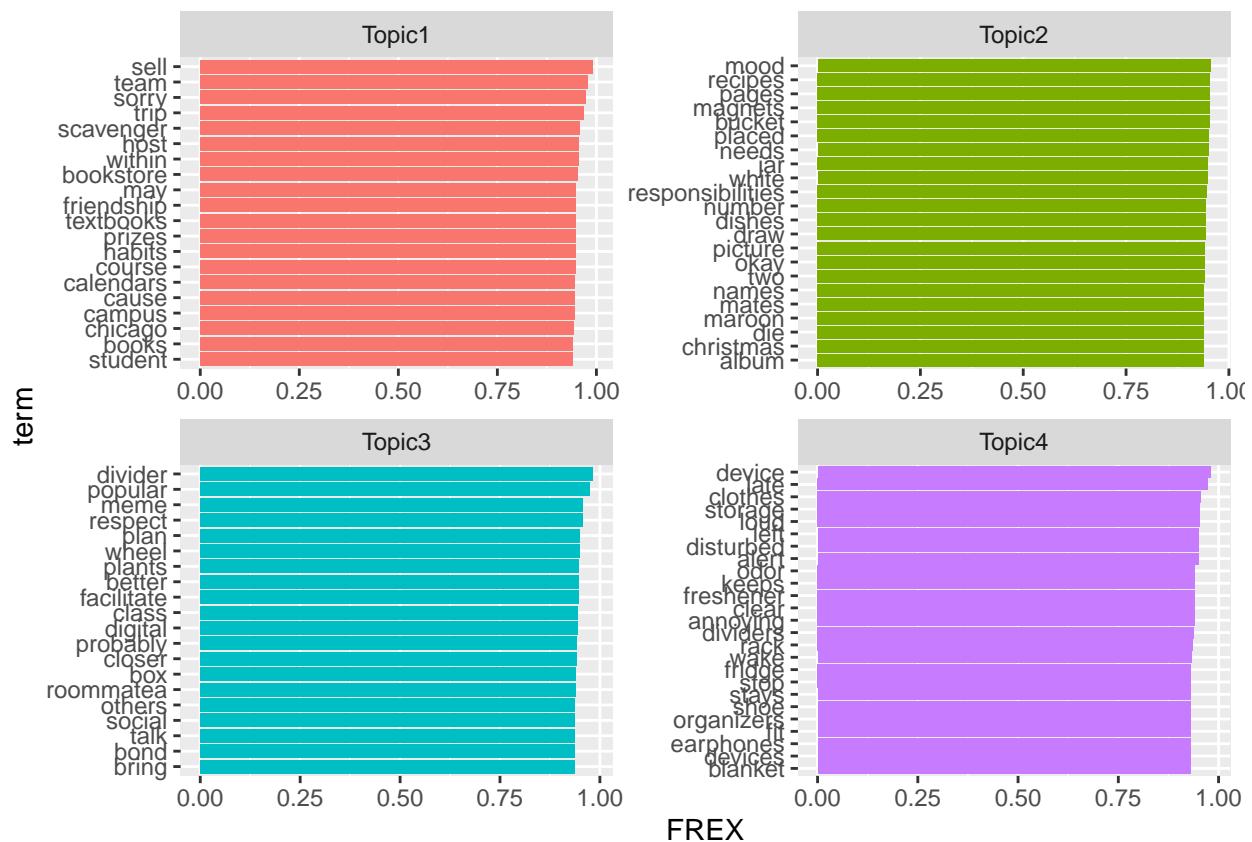

Get top words for each topic using ggplot.

```
frex_top <- word_frex %>%
  pivot_longer(2:5, names_to = "topic", values_to = "FREX") %>%
  group_by(topic) %>%
  top_n(20, FREX)
```

```

frex_top %>%
  mutate(term = reorder(term, FREX)) %>%
  ggplot(aes(term, FREX, fill = factor(topic))) +
  geom_col(show.legend = FALSE) +
  facet_wrap(~ topic, scales = "free") +
  coord_flip()

```

Use wordcloud and FREX matrix to create cloud visuals.

```

library(wordcloud)

dev.off()

## null device
##      1
wordcloud(word_frex$term, word_frex$Topic1)

dev.off()

## null device
##      1
wordcloud(word_frex$term, word_frex$Topic2)

dev.off()

## null device

```

```

##          1
wordcloud(word_frex$term, word_frex$Topic3)

dev.off()

## null device
##          1
wordcloud(word_frex$term, word_frex$Topic4)

```

To help with labeling topics:

```

labelTopics(text_stm_4)

## Topic 1 Top Words:
##      Highest Prob: sell, get, can, bookstore, games, books, book
##      FREX: sell, team, sorry, trip, scavenger, within, host
##      Lift: band, course, debate, future, habits, prizes, roommatesbooks
##      Score: sell, band, books, trip, bookstore, eating, friendship
## Topic 2 Top Words:
##      Highest Prob: two, things, one, like, write, people, different
##      FREX: mood, bucket, magnets, pages, recipes, placed, needs
##      Lift: addressed, album, asks, bullet, caused, christmas, die
##      Score: hanged, questions, dishes, product, die, turn, experiences
## Topic 3 Top Words:
##      Highest Prob: can, together, will, room, people, like, help
##      FREX: divider, popular, meme, respect, plan, wheel, better
##      Lift: magazines, model, mutual, pins, -person, building, causes
##      Score: divider, bond, talk, can, digital, popular, model
## Topic 4 Top Words:
##      Highest Prob: can, room, gift, one, door, get, alarm
##      FREX: device, late, clothes, storage, loud, alert, disturbed
##      Lift: blanket, devices, earphones, fit, organizers, shoe, stays
##      Score: pong, gift, device, alarm, door, late, light

```

## Regression with human ratings of creativity

Results: As shown by the multiple R-squared statistic, the proportion of variance explained in human-rated creativity scores by topics 2, 3, and 4 is about 4.66%.

```

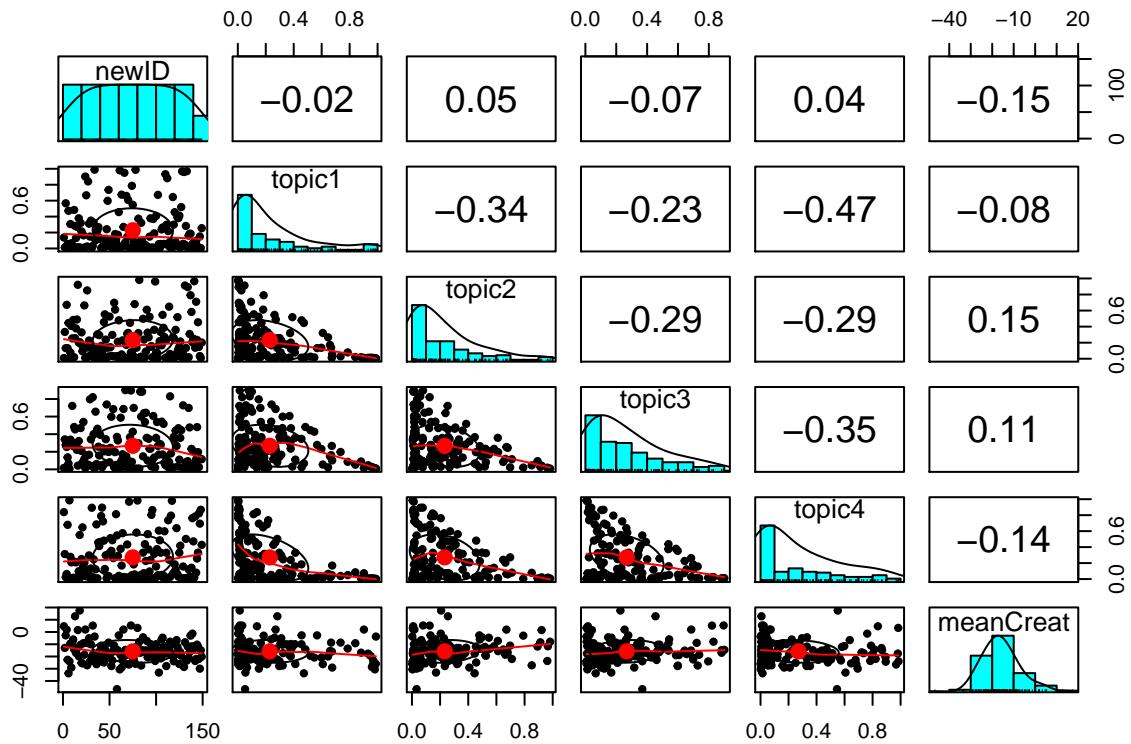

topic_prev <- tidy(text_stm_4, matrix = "gamma") %>%
  pivot_wider(names_from = "topic", values_from = gamma,
             names_prefix = "topic") %>%
  rename(newID = document)

humanratings <- creativity %>%
  mutate(newID = 1:n()) %>%
  select(-localid)

merge_all <- full_join(topic_prev, humanratings)

pairs.panels(merge_all)

```

```
